Appendix A: Additional information on WHO clean distinction:

The WHO's classification of 'clean' is based on a stove or stove/fuel combination meeting specific tiers for emissions of particulate matter (PM_{2.5}) and carbon monoxide (CO), as measured in a laboratory setting and as formalized in the International Organization for Standardization (ISO) 19867-3 Voluntary Performance Targets (VPTs). Stoves achieving Tier 4 for PM_{2.5} emissions and Tier 5 for CO emissions have been linked to reduced health risks.

Appendix B: Citations of randomized controlled intervention trials on LPG
